

# HONEYDRIPPER

FX Type: Filter

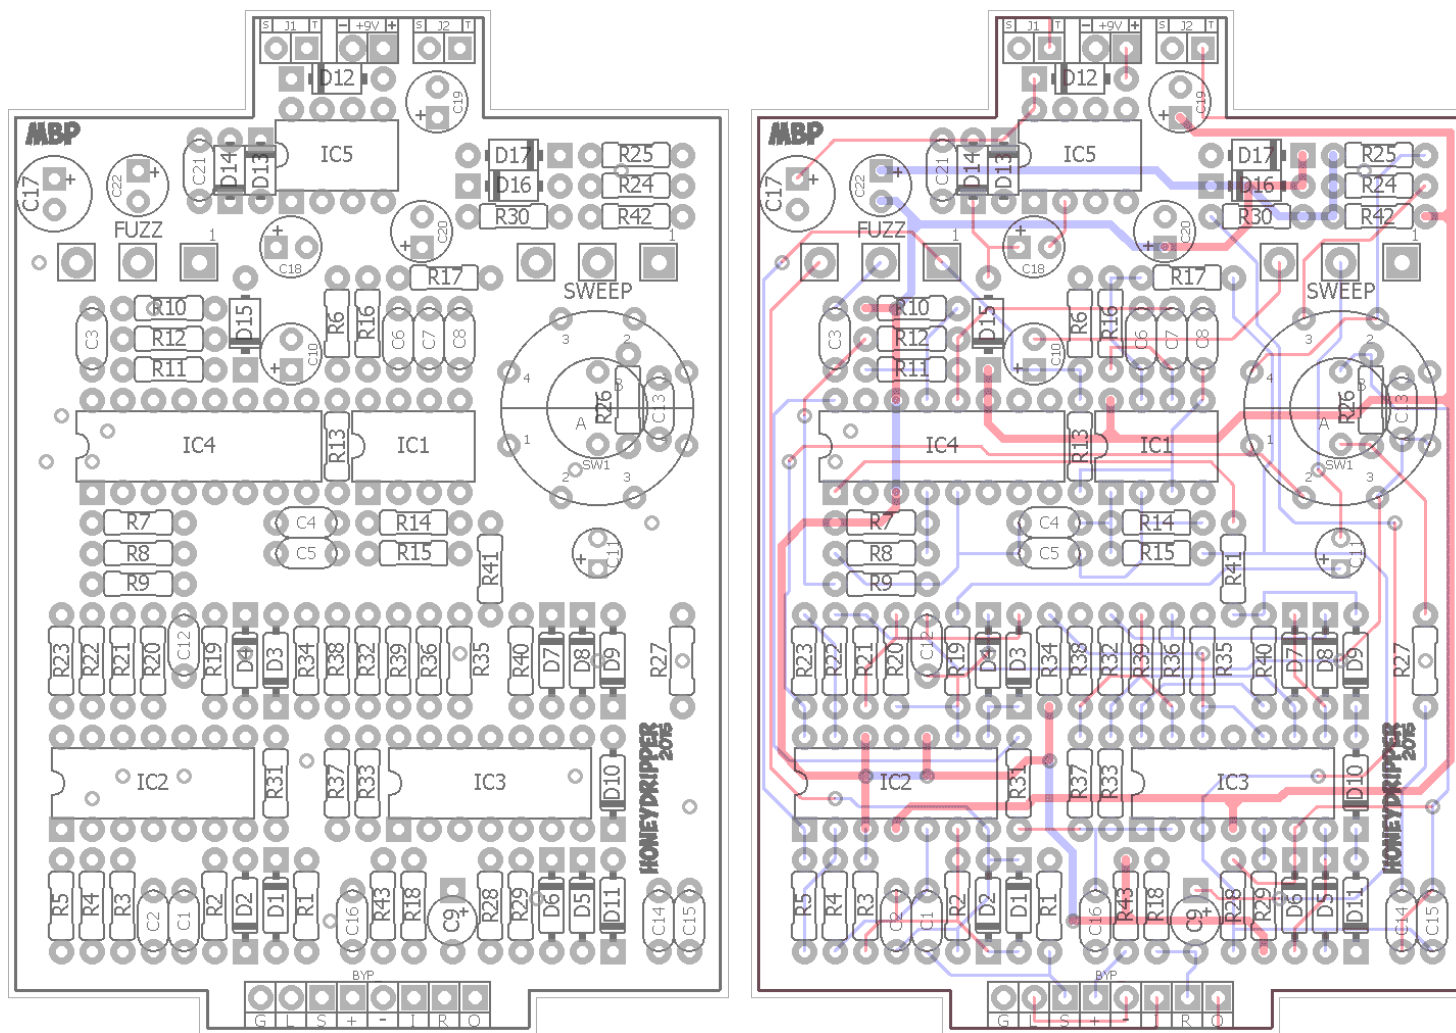

Based on the Colorsound® Dipthimizer™

© madbeanpedals

2015 Version

Previous Versions: <http://www.madbeanpedals.com/projects/ARCHIVE/FilterMod/>

2.35" W x 3.35" H

**Terms of Use:** You are free to use purchased **HoneyDripper** circuit boards for both DIY and small commercial operations. You may not offer **HoneyDripper** boards for resale or as part of a "kit" in a commercial fashion. Peer to peer re-sale is, of course, okay

The ~~rotary switch is included~~ with the purchase of the HoneyDripper 2015 PCB. The switch has a knurled shaft instead of a smooth one like the Alpha in the previous version. Just be sure that you order/use a knob made for knurled shafts or you're going to have a bad time.

**2017 Update: The rotary switch is no longer included with this PCB.** However, it is now available from Smallbear: <http://smallbear-electronics.mybigcommerce.com/rotary-switch-miniature-2p4t/>

# HONEY DRIFTER

based on the Colorsound Diphonizer

(c) madbeanpedals 2015 version

# 125B Drill Guide

5.52" W x 7.65" H

Download the Photoshop template:

[http://www.madbeanpedals.com/projects/HoneyDripper/docs/HoneyDripper\\_DRILL.zip](http://www.madbeanpedals.com/projects/HoneyDripper/docs/HoneyDripper_DRILL.zip)

Tip: When mounting the knob on the rotary switch, turn it to the "bow" setting. This will allow you to mount the knob perpendicular to the enclosure so it will line up with the hash marks shown above.

# Wiring Guide

Pots, Switch and indicator LED should be soldered directly to the PCB.

The **Honey Dripper** is based on the Colorsound Diphonizer™, a very unusual and short lived auto-wah type effect. The Diphonizer™ was only made for a couple of years in the late 70's and thus quite rare. Current eBay offerings price these somewhere close to \$1000. The effect itself is constructed from two parallel multiple feedback filters whose intensity is controlled by an envelope filter. Additionally, there is a four way rotary switch which changes the overall "vowel" driver produced by the envelope.

### 2015 version

- The HoneyDripper has been re-designed to utilize the LM137000 instead of the stock CA3080 (which are becoming increasingly rare and ever-more expensive).
- The Alpha rotary switch has been replaced with a much smaller 2P4T (this was necessary to make the new layout fit in a 125B). **The rotary switch is included with the PCB.**
- The Fuzz pot operation has been switched to clean (full-off) to max fuzz (full-on). This was done as matter of personal preference - it has no impact on the effect other than to make the control more logical.

---

### Controls

**Fuzz** – Controls the amount of fuzz blended in with the clean input signal. Note that the "fuzz" here is not really all that fuzzy. It's more of a gentle overdrive.

**Sweep** – Sets the intensity of the envelope that drives the two filters. The best settings tend to be 1/2 to full up.

**SW1** – This is a 2-pole, 4-terminal rotary switch which changes the vowel type (labeled Yeh, Bow, Wah, Aae).

---

### Mod

- Change **C2** from 2n2 to a smaller value for a brighter sound. My preference here is a 560pF or 680pF. I would not go lower than that (too much noise).

There were a couple other mods listed in the previous version, but overall I think the stock version (plus the mod listed above) is the one to build. I've tested out a lot of possible mods and I keep coming back to mostly stock.

Note: R26 label on the silkscreen was moved off-center. This pic shows the exact location for R26.

Voltages - 9.42 supply

						15	varies		
						16	0.44		

This unit was built stock except for a 680pF cap in C2 and a 1uF film cap instead of the 2u2 electrolytic for C9. R1 was also socketed to try higher values but did not seem to make much of an impact when tested with both single coils and humbuckers.
