

Aquababy24

FX Type: **Delay**

Build Level: Intermediate

Based On: Boss® DM-2™

Last Updated: November 22, 2024 1:58 PM

© 2024 [madbeanpedals](#)

The 2024 version of the **Aquababy** has no circuit changes and some minor layout adjustments. The PCB has been converted from a 2-layer to 4-layer design for low noise operation and the project now offers a PCB mounted pot option.

Overview

The Aquababy is a faithful clone of the Boss® DM-2™ analog delay. It offers up to 300ms of analog delay in a 1590B enclosure. The Aquababy is designed to utilize different BBD types (MN3205 or MN3005) and clocks depending on availability and price. Minimal modifications are required to set the build up for these different BBDs, and this will be explained in detail later on in this document.

Controls

- **MIX**: The ratio of delay vs. clean signal.
- **FDBK**: The number of delay repeats. Maximum FDBK setting will induce self-oscillation.
- **DELAY**: Delay time from slap-back to about 300ms.
- **BIAS**: Used to set the proper bias on the input of the MN3x05 for it to produce clean delay.
- **CANCEL**: Sets the mix of the two delay outputs on the MN3x05.
- **CLOCK**: Sets the correct clock frequency range produced by the MN310x to drive the BBD delay lines in the MN3x05.

Terms of Use: You are free to use purchased **Aquababy24** circuit boards for both DIY and small commercial operations. You may not offer **Aquababy24** PCBs for resale or as part of a "kit" in a commercial fashion. Peer to peer re-sale is fine, though.

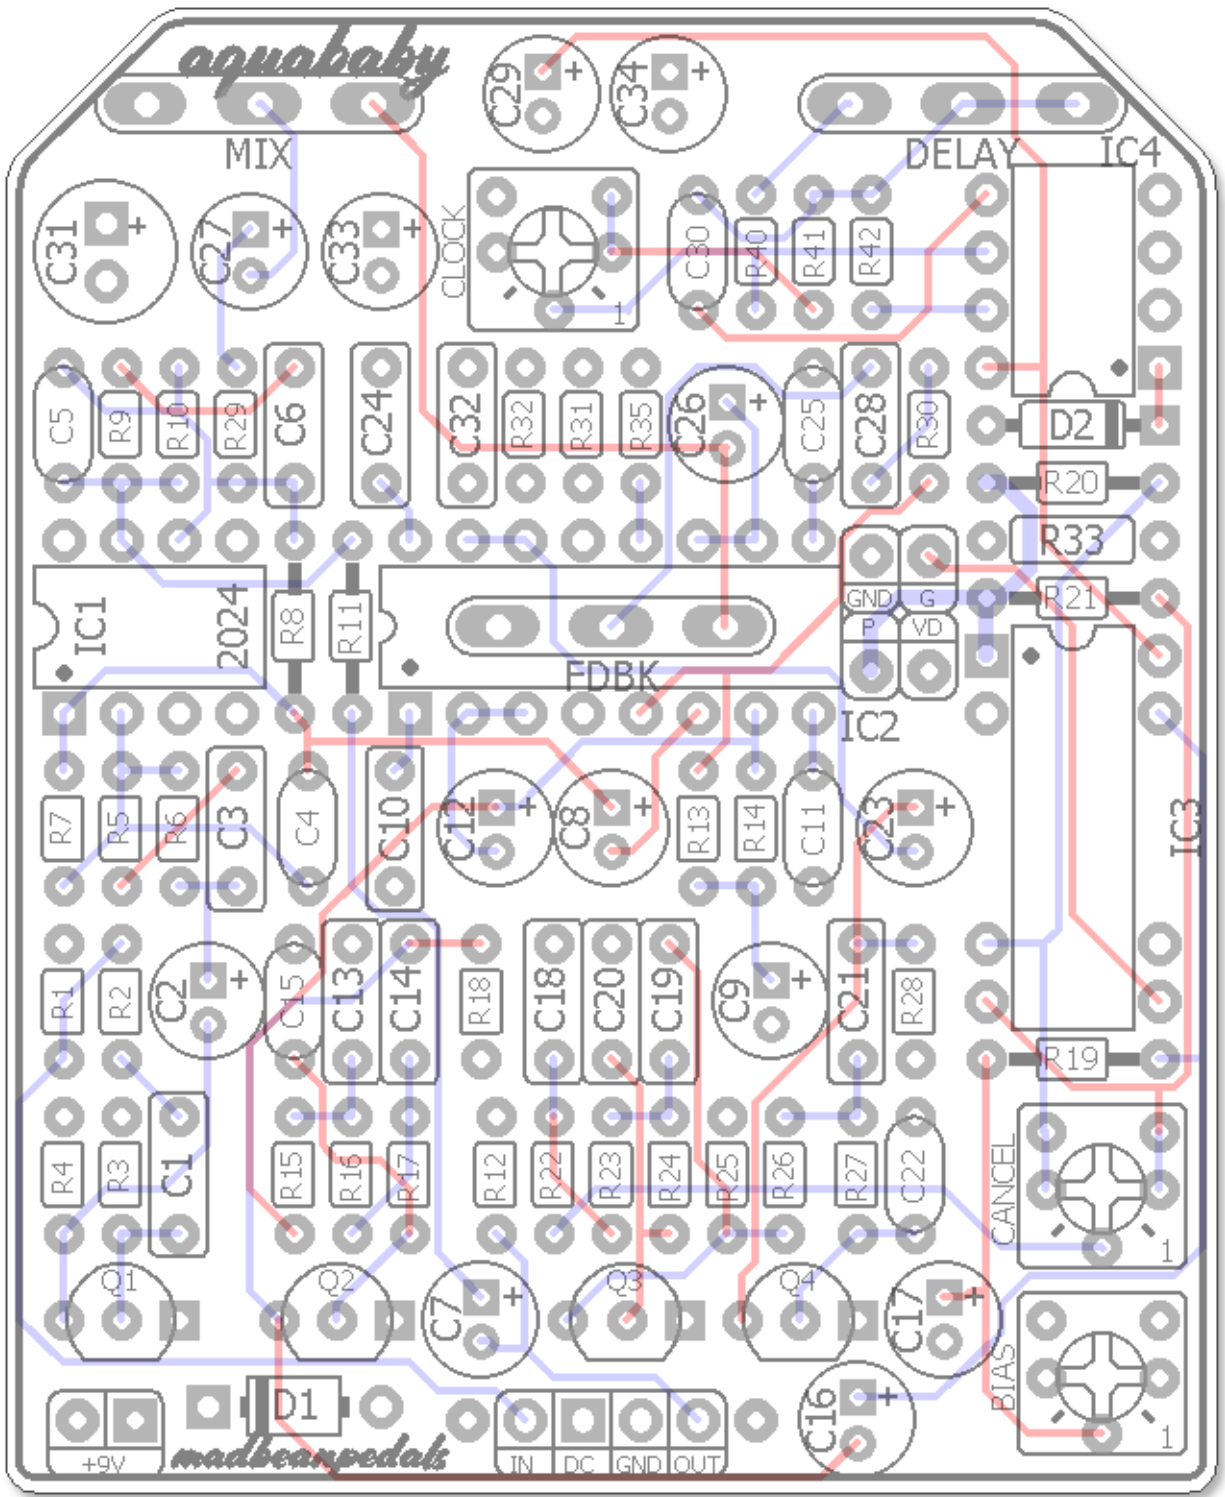

Technical assistance for is available via the [madbeanpedals forum](#). Please go there rather than emailing me for personal assistance. This is because (1) I'm not always available to respond via email in a timely and continuous manner, and (2) posting technical problems and solutions in the forum creates a record from which other members may benefit.

Parts Layout

Trace Layout - Outer Layers

Trace Layout - Inner Layers

Wiring

The Aquababy24 is compatible with the **SSBP** bypass board available at madbeanpedals.

Additional Hardware

- (1) 1590B enclosure
- (2) 1/4" mono jacks
- (1) Slim 2.1mm DC jack
- (1) Standard 3PDT footswitch
- (1) 5mm LED

Build Notes

You can build the Aquababy with the following BBDs: MN3005, MN3205 or v3205. The MN3005 requires an MN3101 clock. The MN3205 and v3205 require either the MN3102 or v3102 clock.

You will need to solder in two jumpers according to which BBD type you use.

Note #1: The v3205 is reported to have a max voltage range of 8v (the MN3205 is usually a little over 9v). If you use the v3205 change R33 from 22R to 1k5 to limit the voltage.

For the Comander (IC2) you can use the NE570, SA571 or v571. They are interchangeable.

Note #2: The FDBK pins go between the socket used for IC2. When populating the pots on the PCB, solder the FDBK pins from the bottom side.

Note #2: R35 is not present in the DM-2. Using a resistor here will raise the output voltage on pins 10&11 for a little more headroom. However, you may need to increase the R20 to offset that increased output. Suggested values for R35 are 18-27k.

Calibration

Make the following adjustments before beginning:

- *Mix control at center.*
- *Delay at full CW.*
- *FDBK at about 1/3 up.*
- *BIAS and Cancel trimpots to their center position.*
- *If you have frequency measurement on your DMM, adjust the Clock trimmer to about 6.5kHz while probing either pin2 or pin4 of IC4. If you don't have this feature set the Clock trim half-way up (note: this is when using a 9v supply).*

Audio probe pin3 of IC3 while either strumming the guitar or send some audio through the input of the circuit. Adjust the BIAS trimmer until you get delay passing. The range over which the trimmer will result in delay is usually about 1/4 to 1/6 of its entire rotation. Continue refining the position of BIAS until you get the smallest amount of distortion on the delay signal. Now probe pin4 of IC3 to confirm it is also passing delay. If it does not, make sure that you have clock frequency on both pins 2 and 6.

Now finely adjust the CLOCK trimmer until just before you hear any high pitch whine or aliasing in the audio path. This is the maximum delay setting. The clock frequency should land somewhere between 6 and 7 kHz but in some cases you may be able to go lower (meaning longer delay).

Unless you are using an oscilloscope to calibrate the delay, leave the Cancel trim in the center position.

Circuit Voltages

IC1	4558	IC3	MN3205	Q3	MPSA18
1	4.76	1	0	C	9.48
2	4.75	2	4.42	B	5.67
3	4.75	3	6.05	E	5.38
4	0	4	6.05	Q4	MPSA18
5	4.75	5	9.46	C	9.48
6	4.75	6	4.42	B	5.41
7	4.74	7	5.07	E	4.77
8	9.48	8	8.3		
IC2	NE571	IC4	MN3102		
1	1.47	1	3.68		
2	1.84	2	5.18		
3	1.84	3	4.92		
4	0	4	8.3		
5	1.84	5	8.81		
6	1.83	6	4.42		
7	2.97	7	0		
8	1.84	8	4.4		
9	1.84	Q1	MPSA18		
10	3.04	C	9.48		
11	3.04	B	4.38		
12	1.84	E	3.96		
13	9.48	Q2	MPSA18		
14	1.84	C	9.48		
15	1.84	B	2.95		
16	0.98	E	2.36		

9.5vDC One Spot
 Current Draw: ~11mA
 Knobs @ 0

These measurements are for the 3205/3102 combo. If you use the 3005/3101, most voltages will remain the same except:

IC3 pins 1 and 5 will swap values and pin8 will be around 0.6V

Drill Template

Coordinates are denoted in (X,Y), drill size format starting from the center (0,0) location of the enclosure.
